

KU Alzheimer's Disease Center

Studies at a Glance

Studies for those with memory loss

Assessment of Safety, Tolerability and Efficacy of LY3002813 Alone and in Combination with LY3202626 in Early Symptomatic Alzheimer's disease (TRAILBLAZER)

A study to assess the safety, tolerability and effectiveness of combination of LY3002813 (IV infusion) and LY3202626 (oral pill) in people with memory loss.

Type of Study: Investigational medicine (chance of placebo)

Who: Individuals with memory loss of 6mo or more, age 60-85

Procedures: MRI's, PET scans, Eye exam, Skin exam, pen and paper tests, questionnaires, blood draws, physical exams

Duration: 22+ visits over 27 months

Compensation: Yes

Therapeutic Effect of Exercise in Adults with Amnesic Mild Cognitive Impairment (EXERT)

A study to test whether physical exercise can slow the progression of early Alzheimer's disease memory problems in older adults

Type of Study: Low or moderate intensity exercise at local YMCA with personal trainer

Who: Underactive individuals with Mild Cognitive Impairment

Procedures: Physical exam, pen and paper tests, questionnaires, blood draws, fitness tests, ECG, MRI and optional lumbar puncture

Duration: 18 months of intervention with about 4 visits a week to the YMCA

Compensation: Yes -YMCA membership and personal trainer fees paid

A Phase 2 Multiple Dose, Multicenter, Randomized, Double-Blind, Placebo-Controlled Study to Evaluate the Efficacy and Safety of ABBV-8E12 in Subjects with Early Alzheimer's disease (AWARE)

A study to evaluate a drug that may slow Alzheimer's progression in those with early AD. The drug is designed to target tau tangles in the brain and will be delivered via IV.

Type of Study: Investigational medicine (chance of placebo)

Who: Individuals with Mild Cognitive Impairment or probable AD

Procedures: PET brain imaging, MRI brain imaging, 2-3 lumbar punctures, study drug infusion, ECG's, blood draws, physical and neurological exams, memory and thinking tests, and questionnaires/interviews

Duration: ~2 1/2 years, about 45 visits

Compensation: Yes

S-Equol in Alzheimer's disease 2 (SEAD2)

A study to test if S-Equol, a compound that acts like estrogen in the body, can improve a particular energy metabolism deficit that is found in persons with Alzheimer's disease (AD)

Type of Study: Investigational medicine (on placebo for half treatment duration and investigational medication the other half)

Who: Individuals with Alzheimer's disease (APOE4 non-carriers)

Procedures: Genetic counseling, physical and neurological exams, blood draws, pen and paper thinking tests, vital signs

Duration: 4 months, 4 visits & 1 phone call

Compensation: Yes

Studies for those without memory loss

Risk Reduction for Alzheimer's disease (rrAD)

A study to test whether aggressive blood pressure and cholesterol lowering through medication and physical exercise can slow the cognitive decline and risk for developing dementia.

Type: FDA-approved medications, moderate intensity exercise or both

Who: Underactive individuals age 60+ with high blood pressure, and family history of dementia or concern about memory

Procedures: physical exam, pen and paper tests, questionnaires, blood draws, fitness tests, ECG, MRI, and vascular measures

Duration: 24 months of intervention

Compensation: Yes

Studies for those without memory loss (cont.)

Investigating Gains in Neurocognition in an Intervention Trial of Exercise (IGNITE)

A study to explore the idea that physical activity may help maintain and improve brain health in older adults.

Type of Study: Treadmill walking or stretching and toning exercise at a local YMCA

Who: Individuals 65-80 who are not exercising regularly

Procedures: physical function tests, body composition measurements, MRI & PET scans, pen and paper tests, questionnaires, blood draws

Duration: 12 months of intervention, with about 4 visits a week

Compensation: Yes –YMCA membership paid

A randomized, double-blind, placebo-controlled, two-cohort parallel group study to evaluate the efficacy of CAD106 and CNP520 in participants at risk for the onset of clinical symptoms of Alzheimer's disease (GENERATION)

Study of efficacy of CAD106 and CNP520 in comparison to respective placebo in participants at the risk for the onset of clinical symptoms of Alzheimer's disease

Type of Study: Investigational medicine (chance of placebo)

Who: Individuals with normal cognition, ages 60-75

Procedures: PET scans, MRI scans, blood draws, physical exams, memory testing, memory evaluations, questionnaires, other optional procedures

Duration: 5-8 years of study treatment with quarterly study visits, 25-37 visits total

Compensation: Yes

Studies for those with or without memory loss

KU Alzheimer's Disease Center Clinical Cohort

A National Institute of Health (NIH) grant funded study to develop and maintain a well characterized group of individual to support further research on memory and aging

Type of Study: Observational (no treatment)

Who: Individuals with memory loss of any age and individuals without memory loss 65 and older

Procedures: Clinical memory assessment, pen and paper test, blood draw

Duration: 3 annual visits

Compensation: No

Relationship of Energetics and Cognitive Trajectory (REACT)

A study to characterize the relationship between metabolic hormone secretion, energy production, and memory

Type of Study: Observational (no treatment)

Who: Clinical Cohort participants with and without memory loss, age 60 and older

Procedures: Mixed meal tolerance test, blood draws, MRI

Duration: 2 visits

Compensation: Yes

Alzheimer's Disease Neuroimaging Initiative 3 (ADNI 3)

A public/private collaboration between academia and industry to study biomarkers and progression of Alzheimer's disease.

Type of Study: Observational (no treatment)

Who: Individuals with normal cognition ages 65-90 and individuals with Mild Cognitive Impairment or mild Alzheimer's disease ages 55-90

Procedures: Participants will undergo longitudinal clinical and cognitive assessments, computerized cognitive batteries, biomarker and genetic tests, PET (FDG, amyloid and tau) and MRI scans and cerebral spinal fluid (CSF) collection

Duration: Up to five years, with annual visits

Compensation: Yes

Studies for those with or without memory loss (cont.)

Aging and Disease Mitochondria (ADMIT)

A study to test the relationship between energy production in cells, genetics, and fitness.

Type of Study: Observational (no treatment)

Who: Individuals with memory loss of any age and individuals without memory loss age 65 and older

Procedures: Blood draw, fitness test, muscle biopsy

Duration: 2 visits

Compensation: Yes

If you have already started your research journey and have received your Potential Participant Information Form, please complete your survey and identify on the last page which of the above studies would be of interest to you.

To learn how you or a loved one can participate in any of these studies, please visit our website at KUAlzheimer.org, click on “Join a Study,” and then click “Complete this form” to get started. Or call our mainline at 913-588-0555 for more information.

If you are a medical provider and would like more information about any of these studies or information to share with your patients, please call our mainline at 913-588-0555 and ask for Recruitment.
